Abstract

Software has become an integral part of almost everything that we use in our day-to-day life; be it our mobile phone or gadgets at home, the air-planes we travel; traffic controls or the banks – software is literally everywhere. Any defect or bug anywhere in any of these systems is more than likely to touch us, affect us and even paralyze the entire system.

Hence quality is about transforming as many of the implied requirements of the customers into stated requirements and meeting all the stated requirements without any defects or bugs.

This Bug Tracking System is being developed in J2EE platform with the mysql as the backend. This application will run on Internet browser like Internet Explorer.
