## **ABSTRACT**

Translation is the communication of the meaning of a source-language text by means of an equivalent target-language text. Speech Translation or language translation is the process by which conversational spoken phrases are instantly translated and spoken aloud in a second language. Speech translation technology enables speakers of different languages to communicate. It thus is of tremendous value for humankind in terms of science, cross-cultural exchange and global business.

The objective of the project is to perform voice based translation of languages. That is to get rid of the intermediate person in translating a language between speaker and listeners. This application is useful for those people who visit other countries or other places occasionally and find it difficult to understand the local languages of that country or place. Every company due to Globalization, wants to communicate with other companies of other countries in their local language itself and it becomes difficult to hire a person from that country who can be used as a language translator.
